

Reporting System

Omni-Reportix

OVERVIEW

With the evolution of mobile technology, the mobile office has become a major trend in enterprise management. In terms of reporting, mobile reporting has also become an urgent need for modern enterprise management. Mobile Reporting allows users to access the reports and do operations on the mobile terminal such as tablets or mobile phones.

Mobile Reporting System

- Application for reporting from the public regarding Military.
- This application will be available to the public to help improve security services in the community.

Reporting server system

- This application is the server base of the Public Reporting System - Mobile application.
- This application is used to manage and follow up interactions related to security incident data reported by the public.

Reports analysis system

- This application is used to carry out the analysis process of incoming reports from the public.
- This application is equipped with various features of modeling, calculation and data visualization to facilitate data analysis of events reported by the public.

FEATURES

Reports Creation

Report creation features influence how a report comes together. Pre-programmed templates and customization abilities allow users to create reports in the way that is best for them. With templates, report creation is quick and simplified. Meanwhile, custom creation offers the functionality to build the exact report you have in mind.

Enterprise reporting tools vendors construct the report creation features of their systems with ease of use in mind. The goal of these features is to make report creation simplified for people of all skill levels. This not only includes templates and customization abilities but additional tools such as drag-and-drop functionality. Report creation tools allow any member of an enterprise to build a visual and informative report.

Reports Viewing

The ability to export reports into different file formats increases shareability. Converting a report into a more accessible format not only facilitates sending but also streamlines embedding into programs or posting online through HTML and PDF formats. Clearly, this feature serves the purpose of increasing the audience for your reports — if boosting views is the goal. If not, these features also simply facilitate the process of sharing reports with team members and clients.

FEATURES

Reports Elements

The elements available through reporting tools determine how your report will look and convey the information presented. Components such as graphs, pictures, maps and more provide options for data visualization. A visually effective report displays the findings uncovered by deep data analysis — and beyond being informative, a good-looking report will attract a greater audience. Visualizations that are both enlightening and well-designed contribute to the goal of sharing your insights with the world.

Reports Designs

Report design features manage the initial stages of report creation. Report design focuses more on the technical side of report creation rather than aesthetic design factors. Data is extracted, organized and prepared for visualization. These features establish a base by preparing the information and creating a structure to build from.

The filtering, sorting and grouping tools continually function throughout the lifecycle of reports, providing data management as you interact with the report. When a report is ready to export and share, pixel-perfect formatting ensures the report looks great printed or on any device.

FEATURES

Reports Delivery

When it is time to share reports, delivery features ensure information is sent to the right place and can be easily interpreted and used by the recipient. This includes adjustments for file type, digital format and language. Accessibility features let users control who can view reports, as well as where, when and how they can do so. Through the use of these customizations, the delivery of information through reports is simplified, individualized and secure. Fine-tuning reports to the specifications of clients facilitates cooperation between your team.

Types

The availability of different report types further expands your options for report functionality and visualization. For example, online analytical processing (OLAP) reports create data representations that focus on the in-depth analysis provided by OLAP tools. Subreports, as the name suggests, show a report-in-report visualization that displays data intersections. Other types of reports present data on finances, performance, productivity and other metrics. Most reporting tools also provide features that allow customizable reports, so users can create a report on any data they need to present.

Document Scanner

Let users scan documents with their mobile device.

Mobile Apps

Let users access, share and edit their files and folders on the go.

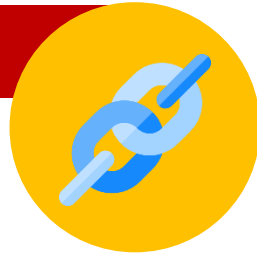

User Management

Let select external contacts login to access select files and folders, speeding up coordination.

Office Integration

Edit documents in the browser – with Collabora, OnlyOffice or Microsoft OOS.
